

### Project Pitch

Situated within Oakland, California, the project implements splayed towers in order to enhance views and shading, as well as capture and reflect noise from the nearby railroad. By splaying the towers in an alternating pattern, the typical commercial long and flat exterior façade then becomes exposed to more surface area which allows for self shading, more views, and a division of increased and decreased noise between each tower. The splayed towers maintain a 70' square module within the parameters, while shifting horizontally.
