

OUR SERVICES

Logistics and Turn-Key Deployment

As technology and standards advance, so does the pressure to deliver facilities and systems that perform at the highest levels and as our clients envisioned. These days, a single piece of equipment involves the input of many different contractors—from specification and installation through operations and maintenance. Our role is to coordinate these different elements, establish the client's goals early in the design process, document them clearly, and monitor them throughout so we can turn over a project that is on time, on budget and on point.

Specific services include:

- Complete logistics and deployment coordination to bridge the gap between construction and facilities ownership.
- Inbound and outbound logistics oversight ensuring accurate equipment delivery tracking and deployment to the new facility.
- On-site coordination with clinical engineering, construction and vendors providing for successful installation and start-up of the equipment.
